A new linear park for Campo di Marte

The project aims to make structural and functional changes to Campo di Marte's station and the related overpass, which represents a fundamental and primary link between the historical city center and Campo di Marte's district.

The crossing is currently out of reach for people with physical impairing and for those who carry bicycles or other light vehicles. The goal is to break down the architectural barriers and make it easy for anyone to cross the overpass and to add a linear park allowing anyone near the station to experience a green, nourishing area and to detach themselves from the chaos of the surrounding city.

Another turning point will be the transformation of the area surrounding the railway, that will become a pedestrian area filled with vegetation, gardens, rest areas, urban parks etc. usable by all citizens.

The goal is the reuse of residual buildings, the revitalisation of the entire area and the disposition of new green infrastructures. More pedestrian bridges are created in order to enhance the connection between Campo di Marte and the city center.

Furthermore, the new hub will represent a pleasant place for the travelers, giving them the opportunity to choose between different means of transportation. Thanks to the future inclusion of the new tram line, the station and its surrounding would become a key point in Campo di Marte's area that will include the train station, tramway stops, bus stops, taxi and bikes points.
